

## Ideation Phase

### Define the Problem Statements

|               |                                               |
|---------------|-----------------------------------------------|
| Date          | 01 October 2026                               |
| Team ID       | SWTID-2026-2085                               |
| Project Name  | Import Data using Transform Maps(spreadsheet) |
| Maximum Marks | 2 Marks                                       |

### Customer Problem Statement – Import Data Using Transform Maps (Spreadsheet)

Create a problem statement to understand the customer's challenges while importing spreadsheet data into Servicenow. The **Customer Problem Statement** helps the team identify difficulties such as manual data entry, incorrect field mapping, duplicate records, and data formatting errors

A well-defined problem statement helps the team develop an effective solution using **Import Sets and Transform Maps**. It enables users to import spreadsheet data accurately, map fields correctly, validate information, reduce manual effort, and minimize errors during the data import process.

#### Customer Problem Statement: Import Data Using Transform Maps (Spreadsheet)

|                            |                                                                                                               |                                                                                                                                                                                      |
|----------------------------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>I am</b>                | <small>Describe customer with 3-4 key characteristics - who are they?</small>                                 | An admin or developer who imports spreadsheet (Excel/CSV) data into ServiceNow tables. I work with tight deadlines, messy data from business teams and limited access to production. |
| <b>I'm trying to</b>       | <small>List their outcome or "job" they care about - what are they trying to achieve?</small>                 | Load spreadsheet data into a ServiceNow table quickly and accurately using an Import Set and a Transform Map.                                                                        |
| <b>but</b>                 | <small>Describe what problems or blockers stand in the way - what bothers them most?</small>                  | The spreadsheet columns don't match the ServiceNow fields, mapping is manual and slow, and the import can create duplicate or wrong records.                                         |
| <b>because</b>             | <small>State the "root cause" of why the problem or blocker exists - what needs to be solved?</small>         | Spreadsheet headers and formats differ from ServiceNow fields, data comes from many teams with no standard template, and errors are hard to trace.                                   |
| <b>which makes me feel</b> | <small>Describe the emotions from the customer's point of view - how does it impact them emotionally?</small> | Worried and frustrated: I fear bad data in production and lose time fixing errors and re-importing.                                                                                  |

#### Example:

| <b>Problem Statement (PS)</b> | <b>I am (Customer)</b>                                                                | <b>I'm trying to</b>                                                                           | <b>But</b>                                                                                  | <b>Because</b>                                                                                                              | <b>Which makes me feel</b>                                     |
|-------------------------------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| PS-1                          | An admin or developer who imports spreadsheet (Excel/CSV) data into ServiceNow tables | Load the spreadsheet data into a ServiceNow table quickly and accurately using a Transform Map | The spreadsheet columns don't match the ServiceNow fields, and mapping them by hand is slow | Spreadsheet headers, date formats and values differ from ServiceNow field names and types                                   | Frustrated and worried about mistakes in the data              |
| PS-2                          | An implementation consultant migrating large amounts of spreadsheet data for a client | Update existing records and add new ones in one import without creating duplicates             | Re-importing creates duplicate or wrong records, and errors are hard to trace               | There is no unique key (Coalesce) set, data comes from many teams with no standard template, and error messages are unclear | Anxious about data quality and about losing the client's trust |
