

Import data using Transform Maps

Persona: an admin or developer importing spreadsheet (Excel/CSV) data into a ServiceNow table

	Prepare	Load	Map	Transform	Verify					
Scenario Preparing, loading, mapping, running and checking a spreadsheet import	How does someone get the data ready before importing?	What happens as the file is brought into ServiceNow?	In the core moments of setup, what happens?	What does the person experience while the data is processed?	What happens after the transform finishes?					
Steps What does the person (or group) typically experience?	Get the file Receive the Excel sheet from the business team	Clean the data Fix headers, blanks and duplicate rows	Create Data Source Choose Excel as file type and attach the file	Load data Create the import set table and load rows	Create Transform Map Set the source import set and target table	Map fields Auto-map, then adjust columns by hand	Run Transform Select the transform map and run it	Watch progress Wait for the transform to complete	Check results Open Transform history and the import log	Fix and reuse Correct errors, re-import, save the map
Interactions What interactions do they have at each step along the way?	Download CSV file and email from the data owner	Target table and fields in ServiceNow	System Import Sets > Data Sources form	Load All Records action on the import set	Transform Map form and Field Map list	Auto Map matching fields and Guidance option	Run Transform action and Transform History	Transform Scripts (configure, create) if needed	Import Set Rows: inserted, updated, ignored, error	Target table list view to spot-check records
Goals & motivations At each step, what is a person's primary goal? ("help me..." or "help me avoid...")	Help me confirm the data is ready to import	Help me know which table it belongs to	Help me get the file into staging quickly	Help me confirm all rows loaded	Help me match columns to the right fields	Help me avoid creating duplicates	Help me insert and update records in bulk	Help me avoid breaking production data	Help me trust the data is accurate	Help me reuse this map next time
Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, or exciting?	The spreadsheet is well structured	Loading to the staging table is quick and safe		Auto Map matching fields saves time	Guidance updates existing records cleanly	Thousands of records load in minutes		Row states make results easy to see	A saved Transform Map can be reused	
Negative moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Messy headers and mixed data formats		Wrong sheet or header row gives an empty load	Reference and choice fields are tricky to map	Mapping many columns by hand is tedious	Fear of bad data landing in production	Little progress feedback on long runs	Error messages are hard to understand	Tracing one bad row takes time	
Areas of opportunity How might we make each step better? What ideas do we have?	How might we offer a spreadsheet template with fixed headers?	How might we preview the sheet columns before loading?		How might we suggest field matches from column names?	How might we warn about missing mandatory fields?	How might we offer a dry run before real inserts?		How might we explain each error in plain language?	How might we re-run only the failed rows?
