

Project Design Phase-II

Data Flow Diagram & User Stories

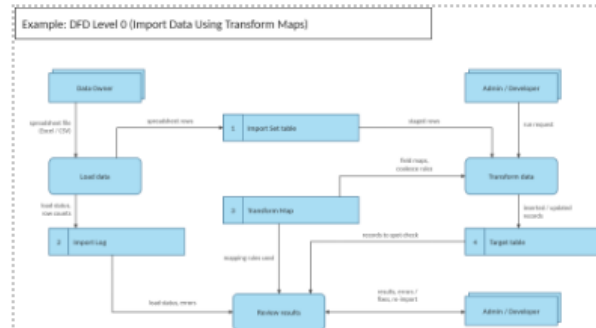

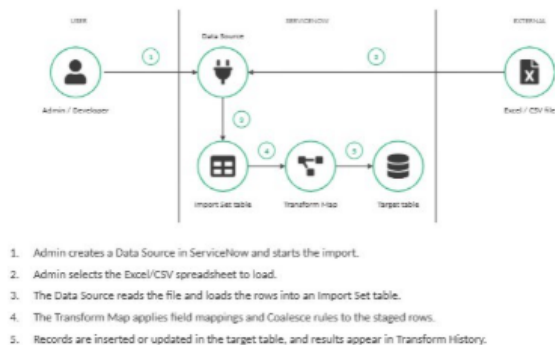

Date	01 October 2026
Team ID	SWTID-2026-2085
Project Name	Import Data using Transform maps(spreadsheet)
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. For importing data using Transform Maps (spreadsheet), a neat and clear DFD shows the right amount of the import requirement graphically. It shows how spreadsheet data enters ServiceNow, what changes the information (loading it into an Import Set table, then applying the Transform Map's field mappings and Coalesce rules), where the data is stored (the Import Set table and the target table), and how the results leave the system (Transform History and the Import Log).

User Stories

Use the template below to list all the user stories for the product: Import Data Using Transform Maps (Spreadsheet).

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Data Owner	Data Preparation	USN-1	As a data owner, I can share the spreadsheet with the admin in an agreed template so the data is ready to import.	The admin receives an Excel/CSV file with the agreed columns.	High	Sprint-1
Admin / Developer		USN-2	As an admin, I can clean blank and inconsistent values in the spreadsheet before importing.	No blank mandatory values or mixed formats remain in the file.	High	Sprint-1
		USN-3	As an admin, I can standardize column headers and date formats so they match the target fields.	Headers match the template and all dates use one format.	Medium	Sprint-1
	Data Loading	USN-4	As an admin, I can create a Data Source and attach the Excel file.	The Data Source shows the Excel file type and the correct sheet and header row.	High	Sprint-1
		USN-5	As an admin, I can load the spreadsheet data into an Import Set table.	All spreadsheet rows appear in the Import Set table.	High	Sprint-1
	Transform Map Setup	USN-6	As an admin, I can create a Transform Map with the Import Set as the source and the target table.	The Transform Map is saved with the correct source and target.	High	Sprint-2
		USN-7	As an admin, I can map spreadsheet columns to target fields.	All required columns appear in the Field Map list.	High	Sprint-2
		USN-8	As an admin, I can map reference and choice fields so values link to existing records.	Reference values resolve to existing records, with no blank or wrong links.	Medium	Sprint-2
		USN-9	As an admin, I can set Coalesce on a unique field so existing records are updated instead of duplicated.	Re-importing the same file creates no duplicate records.	High	Sprint-2
	Running the Transform	USN-10	As an admin, I can run the transform in a sub-production instance first.	The transform completes without changing production data.	High	Sprint-2
	Verification	USN-11	As an admin, I can review Transform History and the Import Log.	Inserted, updated, ignored and error counts are visible.	Medium	Sprint-2
		USN-12	As an admin, I can fix errors and re-import the corrected data.	The error count drops to zero on the re-run.	Medium	Sprint-2
