

Project Design Phase

Problem – Solution Fit Template

Date	01 October 2026
Team ID	SWTID-2026-2085
Project Name	Import data using transform maps(spreadsheet)
Maximum Marks	2 Marks

Problem – Solution Fit Template:

Problem-Solution Fit for importing data using transform maps (spreadsheet) simply means that you have identified a real problem faced by users who bring spreadsheet

data into a system, and that the transform map you have built actually solves it. It helps administrators, developers and business teams recognize how their data is currently mismatched, which field mappings would work, and why.

Purpose:

- Solve complex data problems in a way that fits how your users actually work, so the transform map handles their real spreadsheet layouts, column names, and formats instead of an idealized template.
- Succeed faster and increase adoption by building on the tools people already use, such as Excel and CSV files, so users can import data without learning a new process.
- Sharpen your communication and training with the right prompts and messages, such as clear field-mapping instructions and validation errors that tell users exactly what to fix.
- Increase touch-points with your users by removing frequent annoyances, such as manual re-entry, duplicate records, and failed imports, and build trust by fixing urgent or costly data errors.
- Understand the existing import process in order to improve it for your target group, by reviewing how data is currently prepared, mapped, and loaded into the target table.

Define CS, fit into CC	1. Customer segment(s) CS Admins, data analysts, and business teams who regularly load Excel/CSV data into a system.	6. Customer constraints CC Limited time and skills, inconsistent file formats, file size limits, restricted production access, small budget.	5. Available solutions AS Manual entry, copy-paste, custom scripts, ETL tools, or unmapped imports. Slow, error-prone, or need coding skills.	Explore AS, differentiate
	2. Jobs-to-be-done / problems J&P Load large spreadsheet volumes into the right target fields accurately, without re-entry, duplicates, or failed loads.	9. Problem root cause RC Source columns, formats, and values don't match target fields, and there's no standard way to map or transform them before loading.	7. Behaviour BE Users keep data in Excel/CSV, rename columns freely, fix data by hand, and re-run imports when errors appear.	
Focus on J&P, tap into BE, understand RC	3. Triggers TR A migration, new vendor or customer list, bulk update, or failed import shows manual entry no longer works.	10. Your solution SL Use transform maps to define how each source column maps to a target field, with field mappings, transform scripts, and coalesce settings to prevent duplicates. This gives a repeatable, accurate, low-effort import that fits the spreadsheet workflow users already have.	8. Channels of behaviour CH 8.1 Online Import guides, tutorials, documentation, forums, and support tickets. 8.2 Offline Spreadsheets shared by email or drives, mapping talks in meetings, help from colleagues.	Focus on J&P, tap into BE, understand RC
Identify strong TR and EM	4. Emotions: before / after EM Before: stressed and unsure records loaded correctly. After: confident, in control, and relieved the import is repeatable.			
				Extract online and offline CH of BE
